Cancer Treatment and Dental Care

The dental clinic at Baylor Charles A. Sammons Cancer Center’s Outpatient Oncology Clinic specializes in dental care for cancer patients. Dental oncology is a focus of dentistry dedicated to meeting the unique dental and oral health care needs that arise as a result of cancer therapy and is devoted to improving the well-being and quality of life for cancer patients.

Before Beginning Cancer Treatment

A diagnosis of cancer comes with many emotions and questions. You and your family may feel overwhelmed with new information and treatment options.

It is important to see a dental oncology professional before beginning your cancer treatment. The goal is to prevent oral infection and reduce oral pain during your cancer therapy as well as long term loss of function. If you have already started your cancer treatment, we can still manage your oral health care needs throughout treatment and beyond.

Dental oncology goes beyond the scope of general dental treatment to include the management of the soft tissues of the mouth and care for the oral side effects encountered during cancer therapy.

Part of Your Oncology Team

As part of your oncology team, the dentist and dental hygienist regularly consult with your other oncology team members. They provide pre-treatment oral assessments and supportive oral care before, during and after your cancer therapy, and on into survivorship.
